For this reason, it is important that more specific criteria are evaluated in a clinical setting in low-resource settings to improve the accuracy of CHD diagnosis in children and adults. In this study, we found that the prevalence of CHD in children aged less than 12 years in peri-urban Surat, India was significantly lower than that reported by Cardenas \*et al.\*[@R15] In contrast, Sharma \*et al.\*[@R12] found that in a similar age group CHD was prevalent in 71/1000 infants in an underserved rural population. The low prevalence of CHD is likely to be due to the differences in accessibility and utilization of CHD diagnostic services in rural versus urban areas. The low prevalence of CHD in this urban area may also be a reflection of the fact that the study was hospital based and thus would include only a significant proportion of children with severe CHD, whereas the Cardenas study was community based and therefore would include a higher proportion of patients with mild CHD or CHD not requiring the services of cardiac

---

surgeons. However, it is also possible that the prevalence of CHD in this urban population is higher than reported here, because sub-clinical CHD is likely to be more common in an urban population. A similar clinical diagnosis of CHD is made in non
